

Irrigation Water Quality – What's in the Water?

Jollin Charest, P.Ag.

Irrigation and Farm Water Division
Alberta Agriculture
and Rural Development

Jan 22, 2014
Irrigation Crop Update
Lethbridge

Why Monitoring Irrigation Water Quality

➤ Value added productivity

- Specialty crops and processing industry
- Livestock industry

➤ 40 municipalities

- Drinking and industrial

➤ Wildlife habitat

➤ Recreation

- Fishing, boating, camping, golfing

Irrigation Water Quality Monitoring

➤ Monitoring in irrigation districts

- Previous study 2006 & 2007
- Current 2011 to 2015

➤ Partners

- ARD, Irrigation council, AIPA, and AAFC

➤ Steering committee

- Irrigation districts
- Producers
- Processing industry
- AIPA
- ARD, AESRD

Available online:
www.agric.gov.ab.ca

Project Objective

➤ Assess Water Quality

- **Food production**
 - Irrigation
 - Livestock water
- **Aquatic environment**
 - Impact of irrigation return on rivers
- **Change in water quality**
 - Source to end of each districts
- **Difference between irrigation districts**
- **Link effect of land use**
- **Establish a baseline database**

Sampling Design

- **4 times per season**
 - June to August
 - Higher irrigation demand
- **~90 sites**

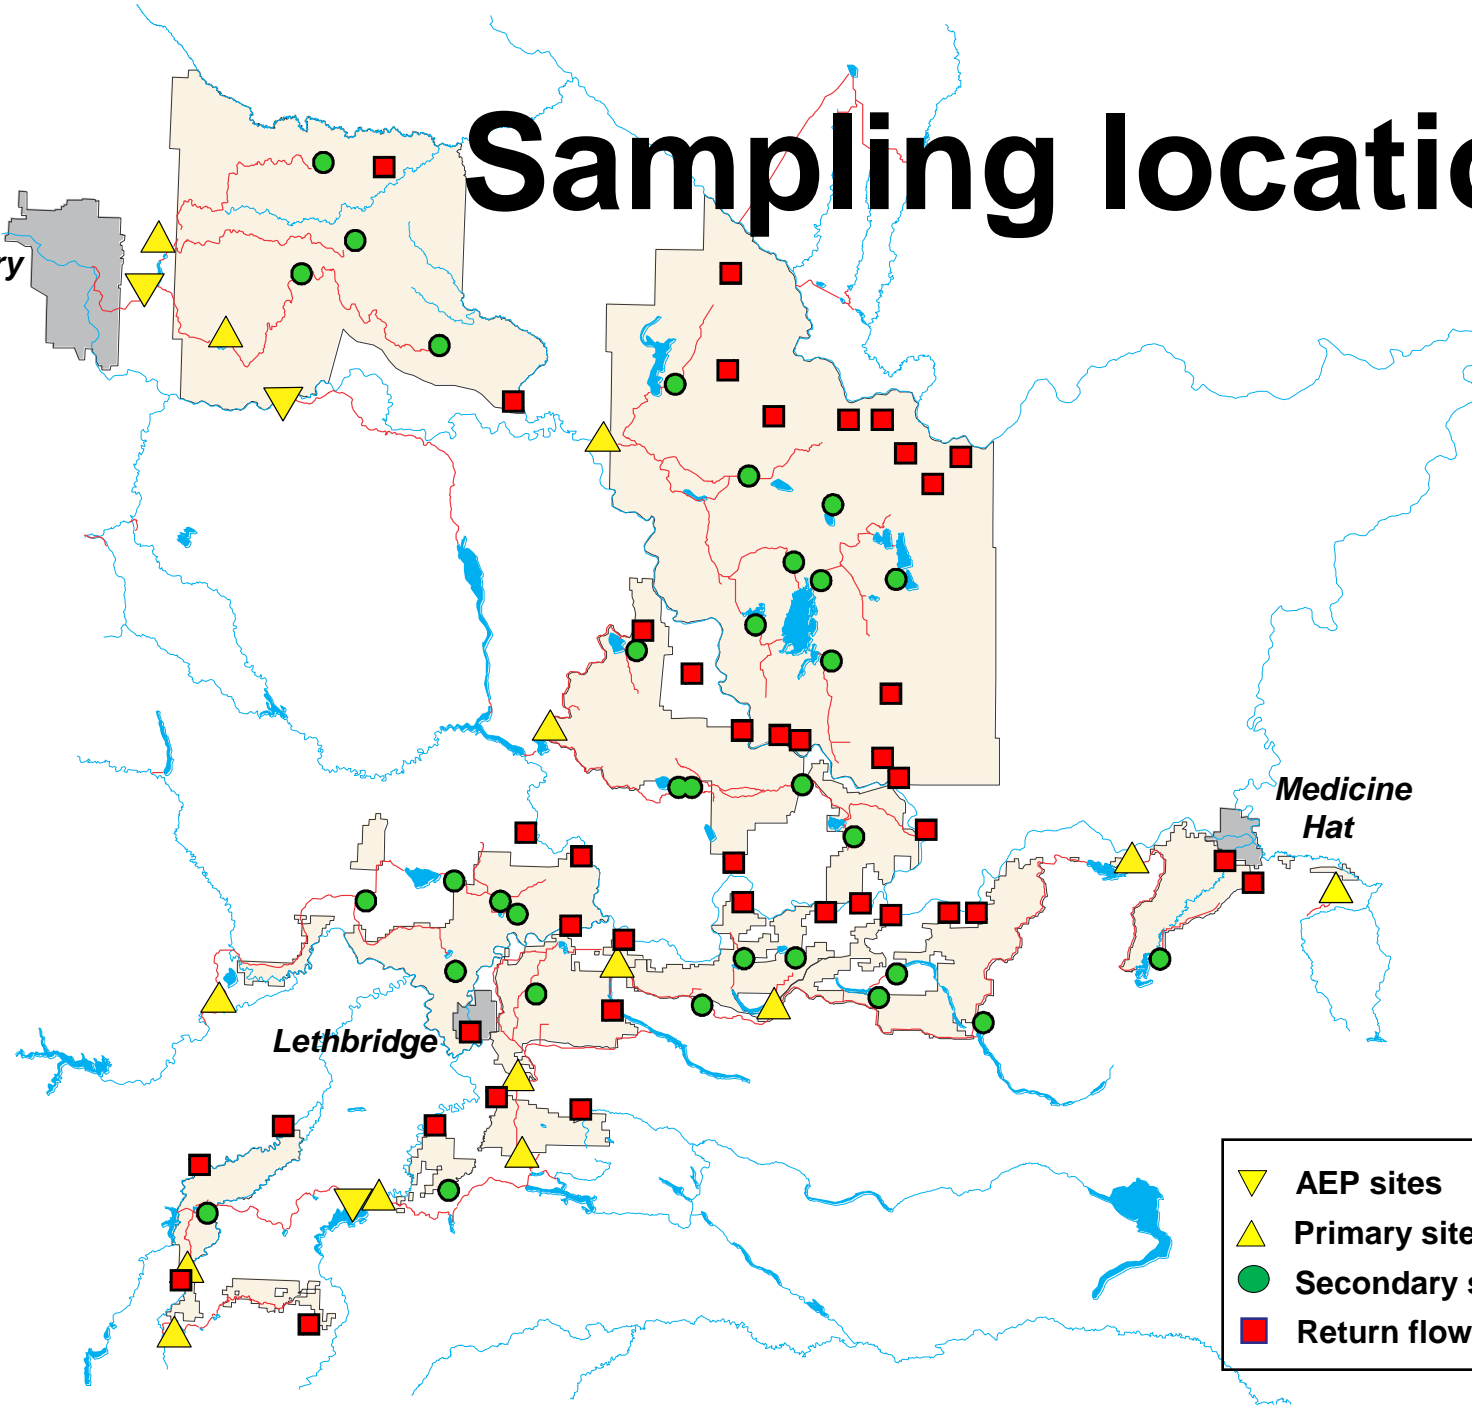

Sampling location

Calgary

Medicine
Hat

Lethbridge

-  AEP sites
-  Primary sites
-  Secondary sites
-  Return flow sites

Study Design

➤ **4 times per season**

- June to August
- Higher irrigation demand

➤ **~ 90 sites**

➤ **> 160 parameters**

- Nutrients
- Salts
- Metals
- Physicals
- Biologicals
- Pesticides

➤ **Guidelines**

- Irrigation, livestock water, aquatic life, and recreation

Guidelines

Science based (maximum) concentration of a substance that is safe for a specific water use

➤ Irrigation guidelines

- Protect the most sensitive crop species
 - Exception for fecal coliform
 - (Human health)
- Based on sensitivity of crop to pollutants and max irrigation rates

➤ Livestock watering guidelines

- Protect all livestock species
- Based on toxicity to animal, daily intake, and potential bioaccumulation

Guidelines

➤ Protection of Aquatic Life

- Protect the most sensitive species and life forms over long term.

➤ Recreation

- Fecal coliform

Water Quality Guidelines

| Parameters | # | Irrigation | Livestock | Aquatic life |
|-------------|-----|------------|-----------|--------------|
| Nutrients | 9 | - | 2 | 3 |
| Salts | 18 | 3 | 3 | 1 |
| Metals | 25 | 18 | 16 | 16 |
| Physicals | 3 | - | - | 1 |
| Pesticides | 107 | 7 | 22 | 35 |
| Biologicals | 6 | 2 | - | - |
| Total | 168 | 30 | 43 | 56 |

So what is in the irrigation water?

- **Results are based on all sites and 5 years of data (~1600 samples)**

Nutrients

➤ Phosphorus and nitrogen

- Different forms and fractions
- Essential for plant growth
- Can promote algal growth
 - Problematic for water flow
 - Eutrophication ($<O_2$)
- Guidelines: no values but existing levels should not increase

Total Phosphorus

Total Nitrogen

Salinity

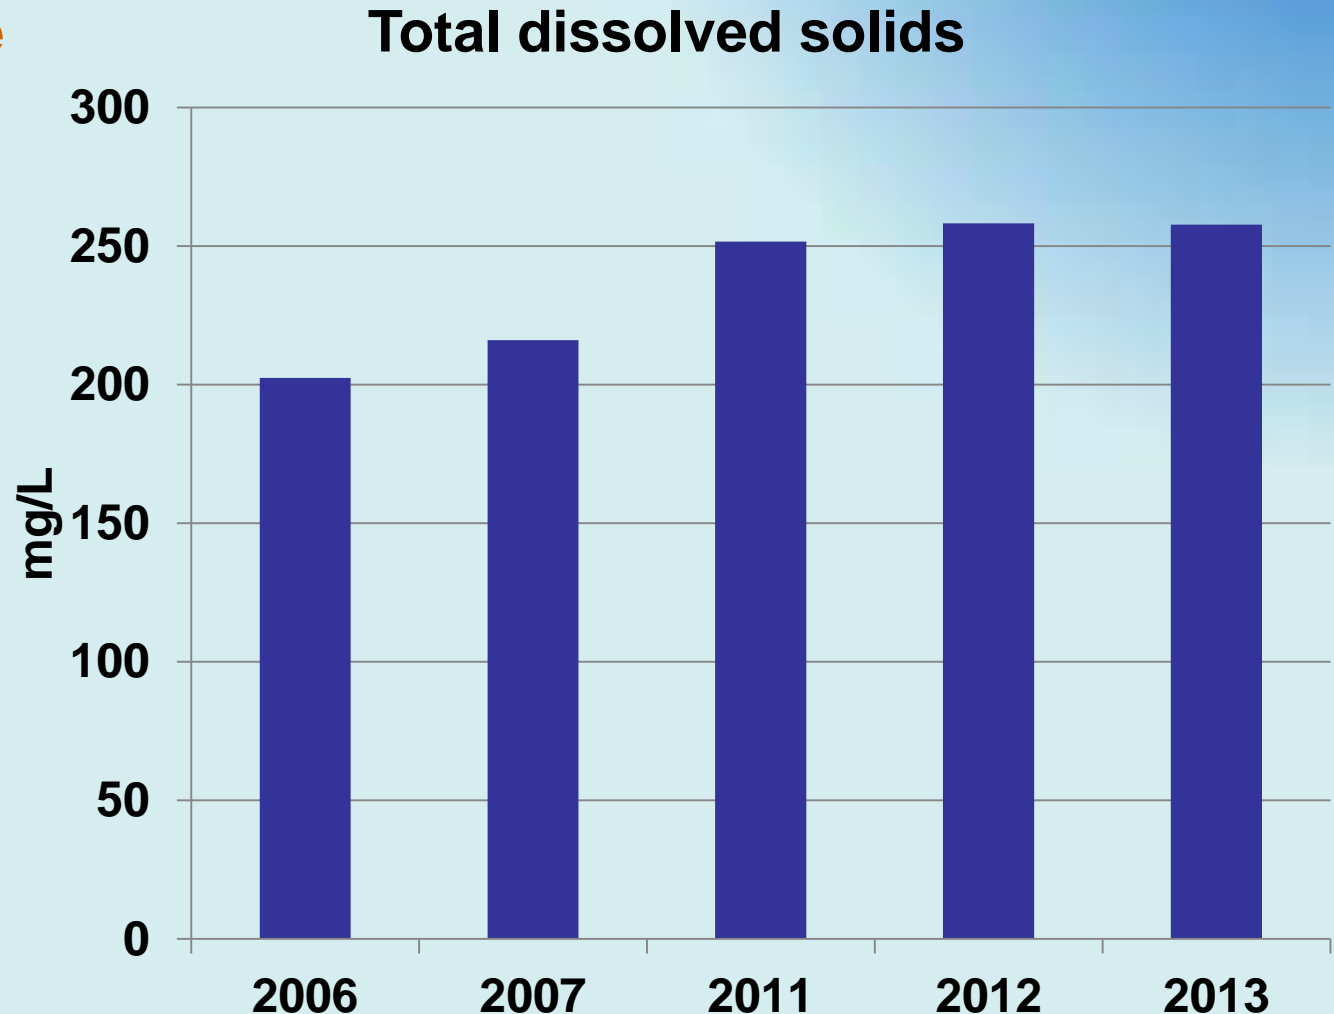

➤ Individual and combined salts

- Sodium, potassium, calcium, chloride, sulphate...
- Totals dissolved solids, electric conductivity, SAR
- Problematic a high concentration
 - Root water uptake
 - Soil structure
- **Guidelines (compliance):**
 - TDS = 500 – 3500 mg/L (95%)
 - SAR - EC = 5 – 1 dS/m (99.7%)
 - Cl = 100 mg/L (100%)
 - SO₄ = 1000 mg/L (99.7%)

EID Secondary Sites (reservoir effect)

- Salts increase over time and distance
 - Evaporation

Metals

➤ Inorganic substances from geological formation

- 25 different
- Aluminum, arsenic, copper, iron, mercury, zinc, etc.
- Can be from industrial release
- Several could be toxic
- Guidelines for 21 metals (compliance)
 - 18 Irrigation (>98%)
 - 16 Livestock (>99%)
 - 16 Protection of aquatic life (Aluminum = 37%, Iron 69%)

Physical Parameters

➤ Temperature, pH, turbidity (suspended solids)

– Aquatic life guideline

- pH (6.5 – 9.0) (5% >pH 9.0)

– Could affect guideline value of other parameters

– Turbidity results

- Decreases in reservoir
- Decreases during season

Biological Parameters

➤ Fecal bacteria

- Indicator of fecal contamination and risk of presence of pathogens
 - *E. coli* and fecal coliform

➤ Pathogens

- Disease causing microbes
 - *Campylobacter*
 - *Salmonella*
 - *E. coli* O157:H7

Coliform Bacteria

➤ Fecal coliform guidelines

– Irrigation

- 100 bacteria/100mL
- Apply to food eaten raw

– Recreation

- 200 bact. /100mL
- Apply to lakes and reservoirs

E. coli irrigation guideline exceedance

Pathogens

➤ No specific guidelines for pathogens

| | <i>E. Coli</i> O157:H7 | <i>Salmonella</i> | <i>Campylobacter</i> |
|------|------------------------|-------------------|----------------------|
| 2012 | 0 | 0 | 4 samples |
| 2013 | 0 | 1 sample | 7 samples |

➤ n= 42 samples (21 sites)/year

- Site selection based on high fecal coliform data

Key Messages on Pathogens

- There have been no incidences of foodborne illnesses linked to irrigation water in Alberta.
- The commercial production and processing chain includes many safety practices.
- Consumers are part of the chain and should always wash fresh produce prior to consumption.
 - Never drink untreated water.

Pesticides

➤ 107 pesticides

- Collaboration with AAFC
- 50 herbicides
- 45 insecticides
- 12 fungicides, nematicides, acaricides, bactericide

Nb pesticide/sample (%)

Pesticide Detection Frequency

Pesticide Guidelines Exceedances

No evidence of field damage reported?

➤ No irrigation guidelines for 2,4-D or glyphosate

- Other guidelines are generally met

➤ Dicamba

- Guideline:

0.006 µg/L Other crops (sunflower) (100%)

0.06 µg/L Legumes (soybean) (36%)

0.6 µg/L Cereals, hays and pastures (2%)

➤ MCPA

- Guideline:

0.025 µg/L Other crops (lettuce) (100%)

0.16 µg/L Cereals, hays and pastures (15%)

Water Quality Indices

➤ Simple synthesis of results

– Irrigation, livestock, aquatic life, or recreation guidelines

– Index calculation:

- How many guidelines are exceeded +
- How often guidelines are exceeded +
- By how much guideline are exceeded

= **Water quality index**

85 – 100 Excellent

70 – 85 Good

55 – 70 Fair

40 – 55 Marginal

0 – 40 Poor

IRRIGATION WATER QUALITY INDEX (2011)

— Main canals

Water Quality Irrigation Index

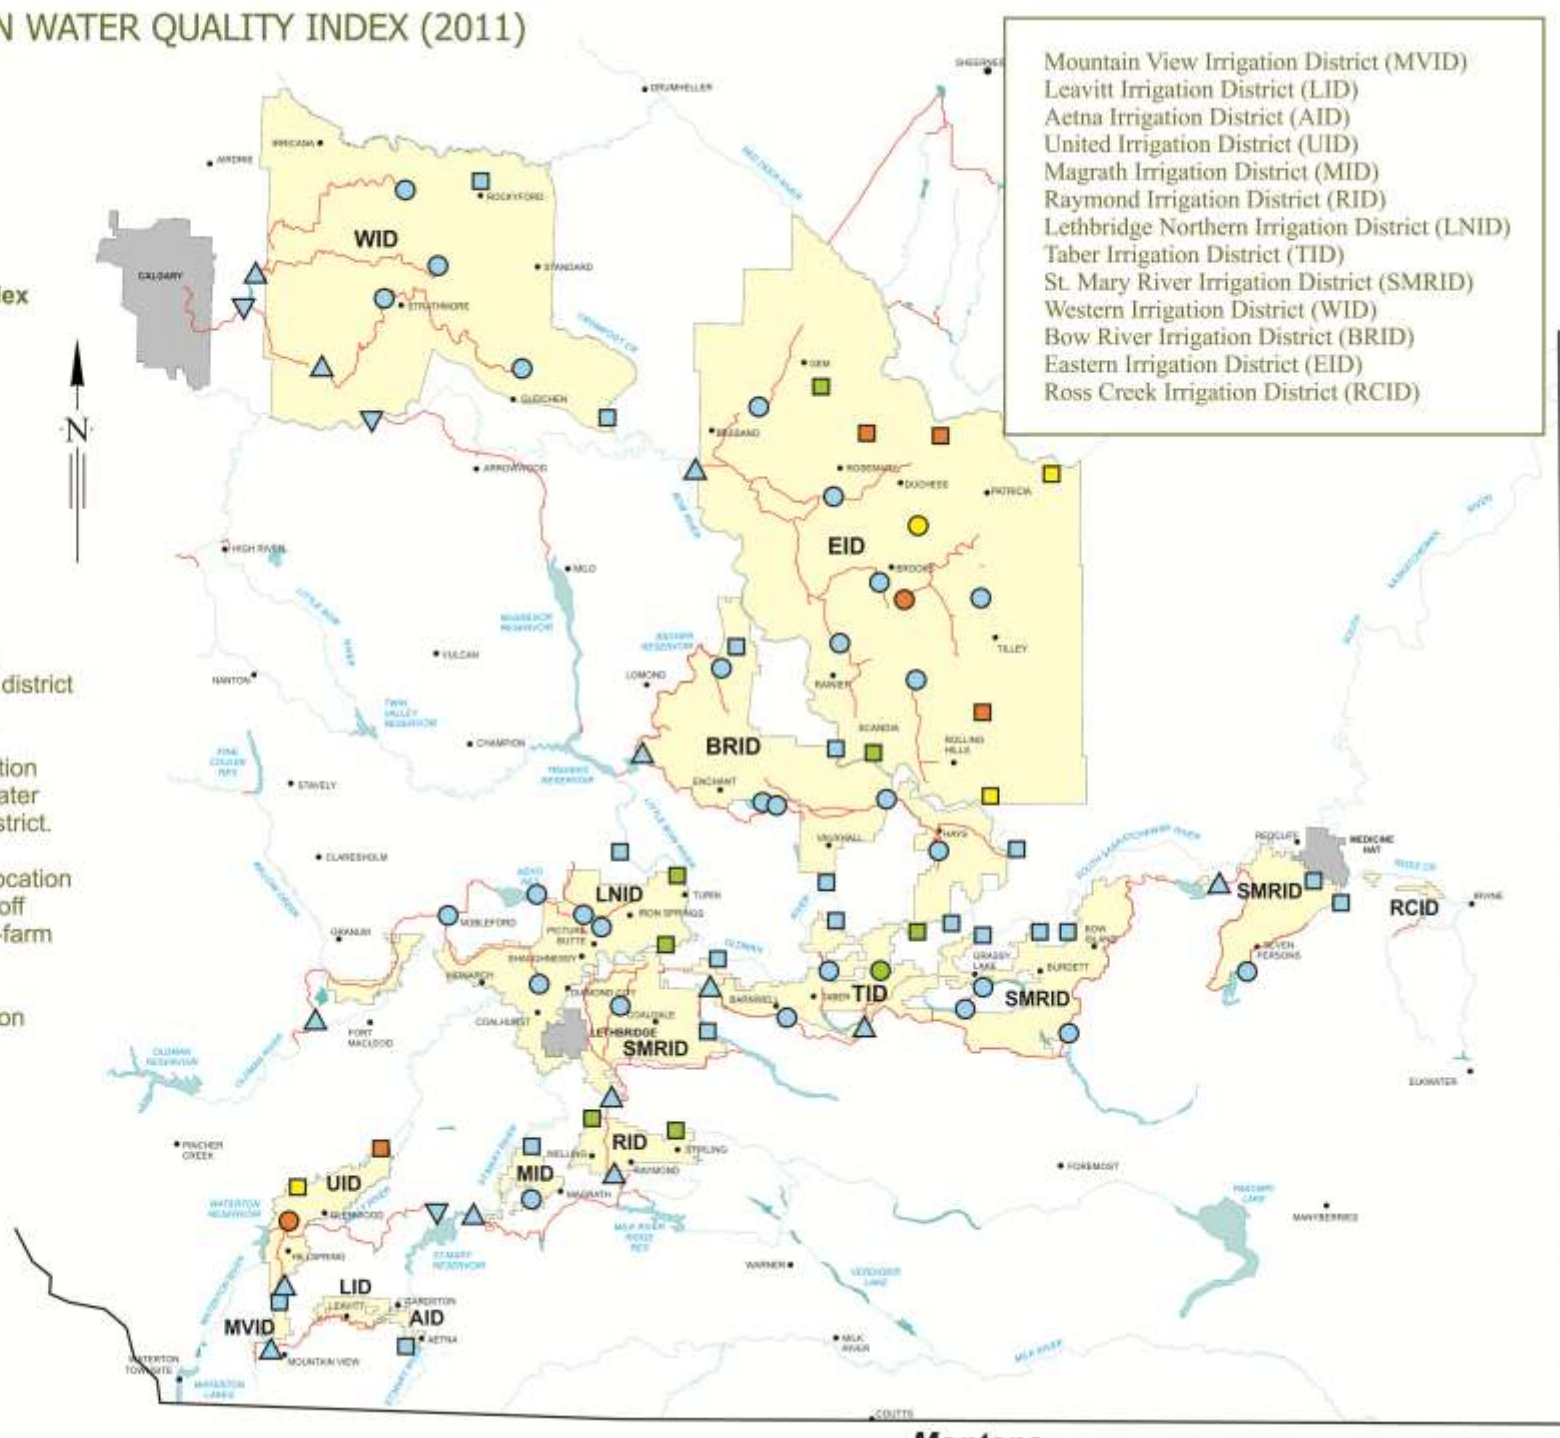

- Excellent
- Good
- Fair
- Marginal
- Poor

Site Class

- ▽ **AEP site** – A location upstream of irrigation district owned infrastructure.
- △ **Primary site** – A location where main source water enters an irrigation district.
- **Secondary site** – A location where canals branch off within a district for on-farm water supply.
- **Return site** – A location where water exits an irrigation district.

Conclusions

- **Water quality interpretation is complex**
 - Several parameters do not have guidelines
- **Water quality index score**
 - Irrigation and aquatic life : generally good or excellent
 - Livestock water: all excellent
- **Water quality tend to decrease as it is flowing downstream**
- **Low concern for salinity and metals in irrigation water**
- **Pesticides and bacteria are responsible for lower score**
